

PHASE 06 · WORKFLOW PLAYBOOK

PolicyBridge Wording Studio

A reusable, productised workflow for wording comparison, redlining, gap analysis and document generation

Wordings reviewed

- Worked example: TMHCC 0223C → final (commit 58b8340) vs six competitor wordings

Captures the exact process developed on the TMHCC Media & Music Combined project so it can be reused for any future wording.

Inputs: a base wording, an old wording, a new draft wording, multiple competitor wordings and a branded template.

Outputs: full tracked wording, clean wording, summary of changes, summary of cover, coverage comparison, gap-fill strategy, enhancement register and legal/UW review notes.

1. Purpose

This playbook documents — as a product specification — the end-to-end workflow used to take a base/old wording, a new draft wording, multiple competitor wordings and a branded template, and produce a market-ready document pack: a holistic tracked-changes wording, a clean final wording, a summary of changes, a summary of cover, a coverage comparison, a gap-fill strategy, an enhancement register and legal/underwriting review notes. It is designed to be built into PolicyBridge Wording Studio so the process is repeatable for future contracts and wordings.

2. Workflow at a glance

Stage	What happens	Stage output
1. Source intake	Upload the OLD / base wording, the current / new draft wording, all competitor wordings, and the branded template. ...	Outputs of stage: a Project with all sources ingested, typed and ordered.
2. Clause parsing & mapping	Break each wording into clauses: sections, definitions, insuring clauses, extensions, exclusions, conditions, warranties, limits/sub-limits. ...	Outputs: a clause map per document + a cross-document concordance keyed by coverage function.
3. Base-to-new redline	Diff the OLD wording against the NEW wording at clause/paragraph level (and word level within changed clauses). ...	Outputs: full tracked-changes wording, clean wording, enhancement register.
4. Competitor comparison	Map competitor clauses onto the base structure via the coverage-function taxonomy. ...	Outputs: a coverage matrix + granular legal-comparison tables.
5. Gap analysis	Identify what competitors cover that the base wording does not (and where the base is broader). ...	Outputs: a gap-fill strategy + a recommendation queue.
6. Iterative wording update	User accepts or rejects each recommendation individually. ...	Outputs: an updated tracked wording reflecting only accepted items; a parked-items log.
7. Output generation	Generate, on demand and branded: final tracked wording; final clean wording; summary of changes; summary of cover; full coverage comparison; gap-fill strategy; enhancement / sign-off register; and legal/UW review notes. ...	Outputs: the full market-ready document pack.
8. Quality controls	No invented cover; trace every recommendation to source wording (clause ID + page). ...	Outputs: a QA report asserting these controls were applied.

3. The workflow in detail

1. Source intake

- Upload the OLD / base wording, the current / new draft wording, all competitor wordings, and the branded template.
- Capture document metadata: insurer, product, version/reference, date, and document role (base / new / competitor / template).
- Set the AUTHORITY ORDER of documents (which wording is the master, which is the baseline, which are comparators) so later steps know what 'wins'.
- Accept .docx and .pdf; extract full text (and, for .docx, paragraph styles) so cover can be compared by legal effect, not by heading.

Stage output: Outputs of stage: a Project with all sources ingested, typed and ordered.

2. Clause parsing & mapping

- Break each wording into clauses: sections, definitions, insuring clauses, extensions, exclusions, conditions, warranties, limits/sub-limits.
- Assign STABLE clause IDs and a normalised clause label so clauses can be referenced across versions and across insurers.
- Map each clause to a canonical coverage-function taxonomy (e.g. 'PL: abuse exclusion', 'Media: defamation', 'Money: touring') so equivalent cover is matched even when headings differ.
- Flag clauses that cannot be confidently classified for human review.

Stage output: Outputs: a clause map per document + a cross-document concordance keyed by coverage function.

3. Base-to-new redline

- Diff the OLD wording against the NEW wording at clause/paragraph level (and word level within changed clauses).
- Generate genuine Word tracked changes (w:ins / w:del) so the redline opens in Word with revisions shown.
- Separate BASE redline changes from UW REVIEW ENHANCEMENTS using distinct tracked-change authors + highlight + annotation.
- Preserve accepted / unaccepted status; never silently merge enhancements.
- Build an Enhancement Register from the tagged enhancements (title, section, location, wording, rationale, support, risk, sign-off, status).

Stage output: Outputs: full tracked-changes wording, clean wording, enhancement register.

4. Competitor comparison

- Map competitor clauses onto the base structure via the coverage-function taxonomy.
- For each coverage feature, determine: equivalent / broader / narrower; identify exclusions and write-backs; identify competitor advantages.
- Score TMHCC vs each competitor (✓ covered / ● partial / ✗ not identified / ? requires review) by LEGAL EFFECT, never by heading.
- Surface asymmetries explicitly (e.g. one insurer excludes a peril while another is silent — the abuse/Tysers case).

Stage output: Outputs: a coverage matrix + granular legal-comparison tables.

5. Gap analysis

- Identify what competitors cover that the base wording does not (and where the base is broader).
- Classify each gap by impact (product gap vs presentational/labelling vs legal-drafting gap) and priority (High/Medium/Low).
- Propose copy-paste-ready gap-fill wording with the EXACT insertion location, mode (automatic/optional/schedule), UW & claims risk, and sign-off.
- Present recommendations ONE AT A TIME for acceptance/rejection; never auto-accept.

Stage output: Outputs: a gap-fill strategy + a recommendation queue.

6. Iterative wording update

- User accepts or rejects each recommendation individually.
- Accepted recommendations become tracked changes (tagged with author + rationale + source support).
- Rejected recommendations are PARKED with their wording and reason retained (nothing is lost).
- Every change retains an audit trail: AI insight, competitor source, coverage impact, UW risk, legal note, exact location.

Stage output: Outputs: an updated tracked wording reflecting only accepted items; a parked-items log.

7. Output generation

- Generate, on demand and branded: final tracked wording; final clean wording; summary of changes; summary of cover; full coverage comparison; gap-fill strategy; enhancement / sign-off register; and legal/UW review notes.
- Export to .docx and PDF; preserve branding (logo, fonts, palette) and hyperlinks/contents where present.
- Stamp each output with the project, source versions and a 'subject to legal/UW sign-off' footer.

Stage output: Outputs: the full market-ready document pack.

8. Quality controls

- No invented cover; trace every recommendation to source wording (clause ID + page).
- Distinguish PRODUCT gaps from LEGAL/DRAFTING gaps and from presentational gaps.
- Mark every underwriting/legal sign-off requirement; keep UW enhancements separately identifiable and unaccepted by default.
- Keep branding consistent; ensure exports are clean and within page margins (no overflow).
- Where a clause cannot be verified, mark '? requires review' rather than assume.

Stage output: Outputs: a QA report asserting these controls were applied.

4. How this works in the app interface

Interface area	Function
Project dashboard	List of wording projects; per-project status (sources ingested, redline ready, comparison ready, recommendations open/accepted/rejected, outputs generated, sign-offs outstanding).
Document intake panel	Drag-drop upload; document typing (base/new/competitor/template); authority-order control; extraction progress and parse-quality flags.
Clause map viewer	Tree of each wording's clauses with stable IDs and coverage-function tags; search/filter; jump-to-source.
Side-by-side wording comparison	Old vs new (and base vs competitor) panes with synchronised scrolling and inline tracked-change markup.
Competitor matrix	Interactive ✓/✗/? matrix by coverage function; click a cell to see the underlying clauses and legal note.
Gap recommendation queue	One recommendation at a time: AI insight, competitor source, coverage impact, UW risk, legal sign-off note, copy-paste wording, exact insertion location, Accept / Reject / Park.
Accept / reject workflow	Accepted → becomes a tracked change; Rejected/Parked → retained with reason; full audit trail; nothing auto-accepted.
Tracked-changes generator	Produces the full Word redline with separate authors for base vs UW enhancements; highlight + annotation; clean version on demand.
Summary document generator	Generates summary of changes, summary of cover, coverage comparison, gap-fill strategy, enhancement register — all branded.
Sign-off dashboard	Outstanding underwriting/legal sign-offs per enhancement; status (awaiting / approved / rejected); owner; date.
Export centre	Branded .docx + PDF exports of every document; bulk 'final pack' export; version history.

5. Data model essentials

- Project → Documents (typed: base / old / new / competitor / template) → Clauses (stable IDs) → coverage-function tags.
- Authority order on Documents drives which wording is master/baseline and which are comparators.
- Recommendations link to source Clause IDs (and page) on BOTH the base and the competitor side — enforcing 'trace every recommendation to source'.
- Tracked changes store author (base vs UW enhancement), rationale, competitor source, coverage impact, UW/claims risk, sign-off status and accepted/parked state.
- Outputs are generated artefacts versioned against the source document versions used.

6. Worked example (this project)

- Sources: TMHCC 0223C (baseline), TMHCC final (commit 58b8340, new), six competitors (Tysers, Yutree, Liberty, Allianz, AXA XL, Entertainment Elite), Tokio Marine HCC template.
- Stage 3 produced a holistic 0223C→final redline (2,161 tracked insertions, 1,105 deletions) with 14 UW enhancements separately identifiable.
- Stage 4 produced a one-page coverage matrix + granular legal tables; Stage 5 produced 15 gap-fill recommendations with copy-paste wording.
- Stage 4 surfaced the abuse/Tysers asymmetry (TMHCC excludes abuse; Tysers silent) — the kind of by-legal-effect finding the studio must reliably catch.
- All outputs branded and exported to .docx + PDF; every enhancement held for UW/legal sign-off.

7. Product acceptance criteria

Definition of done: PolicyBridge Wording Studio is working correctly only when it can reproduce the SAME mapping, comparison, gap analysis, tracked-changes update and document-generation workflow achieved on this TMHCC project — ingesting multiple wordings, parsing clauses, comparing by legal effect, generating the full tracked redline (with separately-identifiable UW enhancements), the clean wording, the summary of changes, the summary of cover, the coverage comparison, the gap-fill strategy and the enhancement register — all branded, traceable to source and marked for sign-off.
