

PHASE 07 · AUDIT / REBUILD PROMPT

PolicyBridge — Audit & Rebuild Prompt

A prompt to give Emergent / Opus to verify (or rebuild) the Wording Studio against this exact workflow

Wordings reviewed

- Test project: the seven TMHCC documents from this workflow

The ready-to-paste prompt is on the next page (Section 2).

Product standard: PolicyBridge is not working properly unless it can reproduce the TMHCC mapping, comparison, gap analysis, tracked-changes and document-generation workflow.

Constraints: discovery first; no destructive changes; no data deletion; no schema changes without review; do not break existing functionality.

1. Current-state context (for the recipient)

Based on the present repository, the PolicyBridge app is currently a 'Document Centre': a FastAPI backend exposes a static list of pre-generated documents (GET /api/documents) with download endpoints (GET /api/documents/download/{filename}), and a React frontend lists and downloads them. It does NOT currently ingest wordings, parse clauses, map clause-for-clause, compare wordings, generate tracked-changes redlines, or support an accept/reject recommendation workflow. The audit/rebuild prompt below is written with that reality in mind: the app today serves OUTPUTS, it does not yet PRODUCE them.

2. The prompt (copy-paste)

AUDIT & REBUILD PROMPT — PolicyBridge Wording Studio (paste into Emergent / Opus 4.8)

ROLE: You are auditing and, where safe, upgrading my existing PolicyBridge app so it can precisely replicate a proven insurance-wording workflow.

CONTEXT: On the TMHCC Media & Music Combined project we took a base/old wording (TMHCC 0223C), a new final wording, six competitor wordings and a branded template, and produced: a holistic tracked-changes redline (with underwriting enhancements kept separately identifiable and unaccepted), a clean final wording, a detailed summary of changes, a six-insurer legal review, a one-page coverage comparison with appendix, a gap-fill strategy with copy-paste wording and exact insertion locations, and an enhancement/sign-off register. The full workflow is documented in the PolicyBridge Wording Studio Workflow Playbook (Phase 06).

PRODUCT STANDARD: PolicyBridge is NOT working properly unless it can reproduce the same mapping, comparison, gap analysis, tracked-changes update and document-generation workflow achieved in the TMHCC project.

DO THIS, IN ORDER:

1. DISCOVERY FIRST. Inspect the current app (backend, frontend, data model, storage) and tell me exactly what it does today, with evidence. Do NOT change anything yet. (Note: today the app appears to be a 'Document Centre' that serves pre-generated documents for download — confirm or correct this.)
2. AUDIT against the ten checks below and answer each YES/PARTIAL/NO with evidence:
 - (a) ingests multiple wordings (old/base, new, competitors, template) as .docx and .pdf;
 - (b) parses clauses (sections, definitions, insuring clauses, extensions, exclusions, conditions, warranties, limits);
 - (c) maps wording clause-for-clause with stable clause IDs and a coverage-function taxonomy (compare by legal effect, not heading);
 - (d) compares base vs competitor wordings and scores by legal effect;
 - (e) generates: full tracked-changes wording, clean final wording, summary of changes, summary of cover, coverage comparison, gap-fill strategy, enhancement register;
 - (f) supports accept/reject recommendation workflow (one at a time; accepted → tracked change; rejected → parked with reason);
 - (g) each recommendation carries AI insight, competitor source, coverage impact, underwriting risk, legal sign-off note, copy-paste wording and exact insertion location;
 - (h) outputs are branded and market-ready (.docx + PDF, clean within margins, contents/hyperlinks preserved);
 - (i) keeps underwriting enhancements separately identifiable and UNACCEPTED by default;
 - (j) can use the seven TMHCC documents as a base project and reproduce the outputs.
3. THEN choose ONE of:

- A. CONFIRM it already does all of this precisely — with evidence (screenshots + a generated sample for each output); OR
- B. PRODUCE a detailed rebuild/update plan (architecture, data model, parsing approach, redline engine, comparison engine, recommendation queue, export pipeline, milestones); OR
- C. IMPLEMENT the missing pieces if it is safe to do so.

HARD CONSTRAINTS:

- Discovery before any change. No destructive changes. No data deletion. No schema changes without review. Do not break existing functionality (the current download flows must keep working).
- Use the seven TMHCC wordings/documents as a TEST PROJECT to prove the workflow end-to-end.
- Keys/config in environment variables only; never hardcode URLs or secrets.

DELIVERABLES:

- A discovery report (what the app does today).
- The ten-point audit answered with evidence.
- Either an evidenced confirmation, a detailed rebuild plan, or the safe implementation.
- A final QA report, screenshots of the working flows, and generated sample outputs (the seven documents) for the TMHCC test project.

ACCEPTANCE: Done only when PolicyBridge can ingest the multiple wordings, parse and map clauses, compare by legal effect, generate the full tracked redline (UW enhancements separately identifiable + unaccepted), the clean wording, the summary of changes, the summary of cover, the coverage comparison, the gap-fill strategy and the enhancement register — all branded, traceable to source and marked for sign-off — reproducing the TMHCC outputs.

3. The ten audit checks (reference)

#	Audit check
1	Audit the current PolicyBridge app end-to-end (backend, frontend, data model, storage) and report what it actually does today.
2	Identify whether it can INGEST multiple wordings (old/base, new draft, multiple competitors, branded template) as .docx and .pdf.
3	Identify whether it PARSES clauses properly (sections, definitions, insuring clauses, extensions, exclusions, conditions, warranties, limits).
4	Identify whether it MAPS wording clause-for-clause with stable clause IDs and a coverage-function taxonomy (compare by legal effect, not heading).
5	Identify whether it COMPARES the base wording against competitor wordings and scores ✓/✗/? by legal effect.
6	Identify whether it GENERATES: full tracked-changes wording; clean final wording; summary of changes; summary of cover; coverage comparison; gap-fill strategy; enhancement register.
7	Identify whether it supports an ACCEPT/REJECT recommendation workflow (one recommendation at a time; accepted → tracked change; rejected → parked with reason).
8	Identify whether each recommendation includes: AI insight; competitor source; coverage impact; underwriting risk; legal sign-off note; copy-paste wording; exact insertion location.
9	Identify whether outputs are BRANDED and market-ready (logo, fonts, palette, contents/hyperlinks, clean within margins; .docx + PDF).
10	Identify whether it can use the SEVEN TMHCC documents as a base project and REPRODUCE today's outputs.

4. Hard constraints

- DISCOVERY FIRST — inspect and report before changing anything.
- NO destructive changes; NO data deletion.
- NO schema changes without review and explicit approval.
- Do NOT break existing app functionality (the current Document Centre download flows must keep working).
- Use the seven TMHCC wordings/documents as a TEST PROJECT to prove the workflow.
- Produce a final QA report; capture SCREENSHOTS of the working flows; attach GENERATED SAMPLE OUTPUTS.
- Keep all third-party keys/config in environment variables; never hardcode.

5. The seven TMHCC documents (test project)

- 1. Full tracked-changes wording (0223C → final redline)
- 2. Clean final wording
- 3. UW Enhancement Register
- 4. Summary of changes (0223C → final)
- 5. Six-insurer legal review / coverage comparison
- 6. Gap-fill / enhancement strategy
- 7. Summary of cover (and/or QA / sign-off register)

These documents (produced in this workflow) are the proof-set: the rebuilt PolicyBridge must be able to reproduce them from the same source wordings, with the same fidelity (full tracked redline with separately-identifiable, unaccepted UW enhancements; branded, traceable, sign-off-marked outputs).

6. Product standard (definition of done)

Standard: PolicyBridge is not working properly unless it can reproduce the same mapping, comparison, gap analysis, tracked-changes update and document-generation workflow achieved in the TMHCC project — with discovery first, no destructive changes, a final QA report, screenshots of the working flows, and generated sample outputs.
